Issue no. 97 / Aug 2014

Subject: CLAAS LEXION feederhouse chain slat support rings on front roller

From: COA Product Management

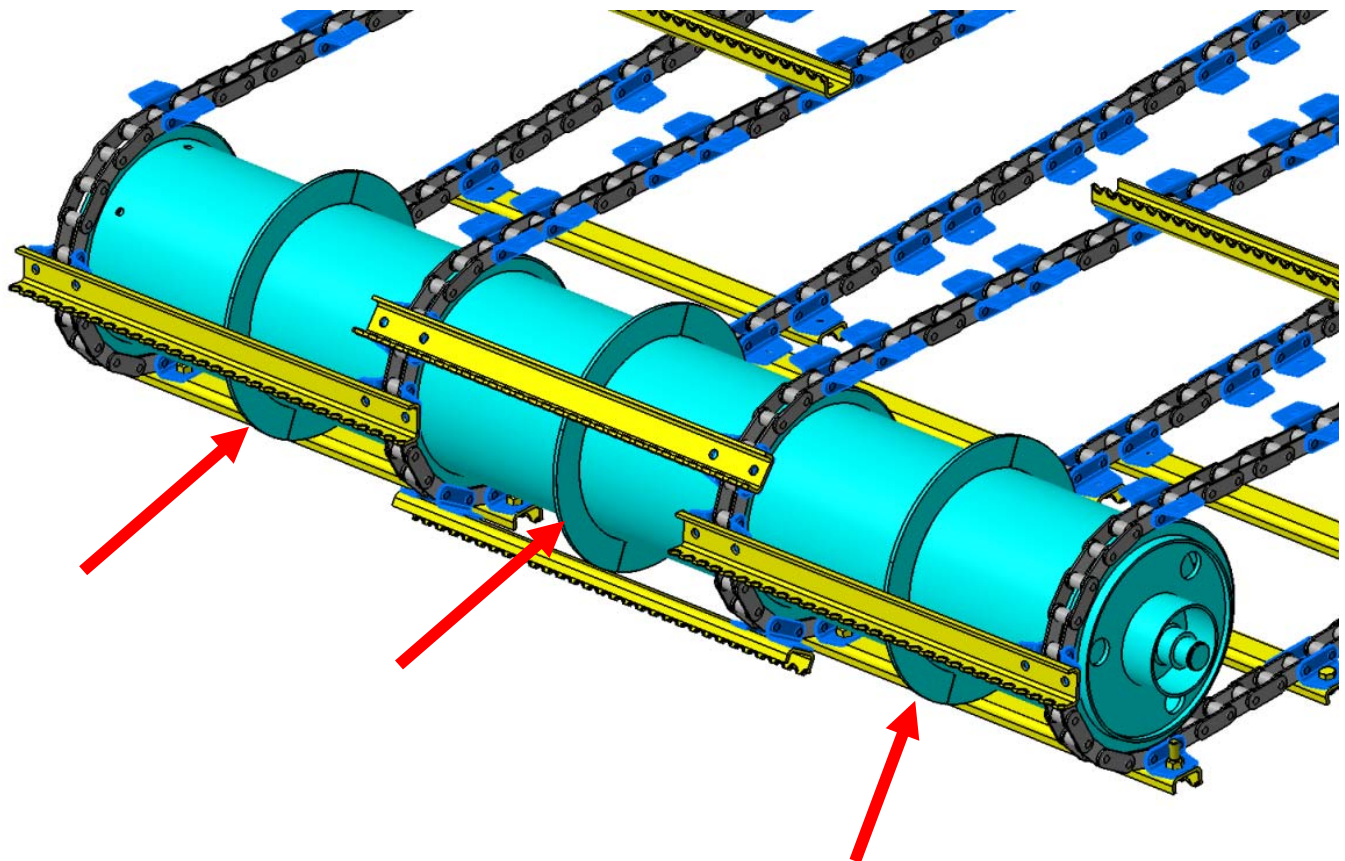

Since the introduction of the CLAAS LEXION 500 Series in 2005, the feederhouse front roller has been enclosed for gentle crop handling (corn) and enhanced rock protection. With the increased use of draper heads on LEXION combines, additional rock protection, especially to prevent bending chain slats, has been requested.

Therefore, CLAAS Engineering and Product Management made weld-on support rings available through parts.

PN: 518 959.0 (each)

Note: order 6 pieces (518959.0) when ordering

The weld-on rings are installed centered between the chain rings on the feederhouse front drum. Please refer to the OMM for proper procedure when welding on CLAAS equipment.
